

2N® NetSpeaker – IP Audio System

We would like to introduce a brand new product to you, the 2N® NetSpeaker. The 2N® NetSpeaker system offers a wide range of features for broadcasting over a local network or the Internet. The system is very flexible, enabling the user to make a particular announcement intended for one group of 2N® NetSpeakers, while simultaneously providing background music for another group of 2N® NetSpeakers. The broadcast for each zone is synchronized with a Server application. This ensures the same high quality of audio broadcast for listeners throughout the entire zone. The number of zones is unlimited. The interconnection of the system is based on a standard IP network. Administrators can access the system very easily and a person making an announcement need not leave the comfort of his office.

The 2N® NetSpeaker system includes the Server application, Admin and User PC application, and 2N® NetSpeaker unit with amplifier, which converts an IP stream into analogue audio signal directly to the connected speaker or large amplifier. The 2N® NetSpeaker unit is available in two versions. The 2N® NetSpeaker Standalone Box allows for the connection of either a speaker or amplifying system. The 2N® NetSpeaker LoudSpeaker set is a speaker together with implemented electronics.

2N® NetSpeaker just won the second round of the IT product of the year 2011 in the category of communications products.
